**LOW DENSITY CAN LINERS**

Description: Low density can liners are often thicker (0.4 - 2.0 mil.) than high density liners, and they offer good strength. Low density liners are more puncture and tear resistant than high density liners, and perform well with loads that may contain sharp objects but are not to weighty.

<b>HIGH DENSITY CAN LINERS</b>										
Description: High density can liners are stronger and more durable than low density liners. They are about one-third the thickness (6-22 microns) at the same strength, so they require less storage space. High density liners may puncture or tear easier than low density liners. They perform
